

ReceiptIQ

Access Guide

How to open and use the receipt scanner

Two ways to open ReceiptIQ

There are two addresses. Both open the same application and show the same data - only the route to the server is different. Use whichever one matches your situation.

Your situation	Address to use
Connected to the company VPN	http://10.0.2.2:8002
VPN is off, or you are working from outside the office	https://stayed-finder-present-audit.trycloudflare.com

The VPN address is faster because the traffic stays inside the office network. If it does not open, check that your VPN is connected - that address only exists inside the VPN.

Signing in

1. Open one of the two addresses above in your browser.
2. Enter the username and password you were given.
3. Click Sign In.

Scanning receipts

1. Click Choose Files, or drag your receipts onto the upload box.
2. You can add up to 5 receipts at a time. JPG, PNG, WEBP, GIF and PDF are accepted, up to 10 MB each.
3. Click Analyze. Each receipt moves through Queued, then Analyzing, then Done.
4. Results appear one by one as each receipt finishes. You do not have to wait for the whole batch.
5. Click a receipt name at the top to see its details: shop, date, items and totals.

You can close the browser while receipts are being read. The work continues on the server, and the results will be waiting under History when you come back.

Looking at earlier receipts

Click History in the top bar. Every receipt that has been processed successfully is listed there, newest first. Click any row to open its full details again.

If something does not work

What you see	What to do
The VPN address will not open	Check that your VPN is connected. If you cannot use the VPN, use the second address instead.
The second address will not open	This address changes whenever the server is restarted. Ask IT for the current one.
A receipt says it failed	The message on screen explains why. Most often the scan is too dark or too small to read - try a clearer photo.
A receipt stays on Queued	The server is busy or was just restarted. Give it a minute, then refresh the page.

Good to know

- Receipts are read by a model that runs on the company server. Nothing is sent to any outside company or online service.
- A receipt usually takes a few seconds. A long or detailed page can take longer.
- If a shop name comes out blank, the print was too faint for the model to read. The rest of the receipt is still saved.
